

# Junction — General Settings

The Junction plugin for WordPress is flexible and easily customizable, allowing you to change parameters in a few clicks.

## Customization, Assignments and other Settings

**General Settings**

Note. The plugin process only external links. All settings related to outbound links only. If any attributes are set for the link, the plugin will not change them. Thus, you always have complete control over your site.

**Open in New Tabs** ☒ Because outbound links deliberately send people away from your site.

**Add rel="noopener"** ☒ rel="noopener" prevents the new page from being able to access the window.opener property and ensures it runs in a separate process.

**Add rel="noreferrer"** ☐ Same as the previous setting and also prevents the Referer header from being sent to the new page.

**Add rel="nofollow"** ☒ rel="nofollow" tells search engines not to follow links and do not associate your site with the linked page.

**Add rel="dofollow"** ☐ rel="dofollow" links pass on ranking power from your website to the targeted page. Be careful, it is better to set this parameter manually individually for each link.

**Skip Links**

Enter (part of) the URLs to match. Use a new line for each different match.

**Open in New Tabs:** Because outbound links deliberately send people away from your site.

**Add rel="noopener":** prevents the new page from being able to access the window.opener property and ensures it runs in a separate process.

**Add rel="noreferrer":** Same as the previous setting and also prevents the Referer header from being sent to the new page.

**Add rel="nofollow":** tells search engines not to follow links and do not associate your site with the linked page.

**Add rel="dofollow"** links pass on ranking power from your website to the targeted page.

Be careful, it is better to set this parameter manually individually for each link.

**Skip Links:** Allows skipping some links, for example to the domains of your partners.

Enter (part of) the URLs to match. Use a new line for each different match.

**Assignments Settings:** By selecting the specific assignments you can limit where the plugin should or shouldn't be work.

To have it working on all pages, simply do not specify any assignments.
